Prosura attackers claim to have obtained nearly 100 million lines of data from the VroomVroomVroom partner earlier this month. The Cybernews research team believes that the data posted by attackers could be legitimate.

Prosura, which sells car rental insurance in partnership with VroomVroomVroom, is grappling with a major cyber incident. The company noted a data breach last week after a third party ravaged through Prosura's internal IT systems.

The extent of the attack reached a point where the company's clients were contacted by hackers with details about their insurance policies and personal data. Now, however, the attackers appear to be attempting to sell the data.

Information, likely stolen from Prosura's systems, was posted on a popular data leak forum used by gangs to exchange often stolen information. According to the post's author, the dataset includes a whopping 98 million lines of records.

The Cybernews research team has investigated the data sample attached to the post, noting that the attackers' claims appear to be legitimate. The sample includes photocopies of driver's licenses and full insurance policies, which are stuffed with personal identifiable information (PII).

"We are also working with experts from across the cybersecurity industry to assist with our response to the incident and have sophisticated monitoring in place to detect any further developments," the company explained via the incident response page.

The data breach will undoubtedly have a financial impact on Prosura as the company [reportedly had to halt sales](#) of new policies and its online self-service to mitigate the attack. Prosura, which also trades as Hiccup, operates mainly in Australia and New Zealand.

So far, it appears that only customer personal details and insurance policies have been accessed, and no payment information was exposed. According to the company, it does not store credit card details on its systems.

However, some of the company's customers were likely spooked by the attackers who attempted to contact them. According to screenshots shared with ABC, the attackers sent emails to

Prosura customers, explaining that the company owned their data and that it was for sale.
