AI Image Detection & Media Verification Report

File: test.png

Date: 2026-03-01 08:16:28 UTC

FIRST OBSERVATIONS

Who: A man dressed as the fictional character Batman.

What: A person in a superhero costume is posing for a portrait.

Where: An urban setting with tall buildings in the background.

When: Daytime.

Why: To depict the fictional character in a realistic-looking city environment.

AI-Generated — Confidence: 90%

FORENSIC ANALYSIS

Verdict: AI-Generated

Confidence: 90%

AI DETECTED (90% confidence): This image was generated by AI. Evidence: Content analysis indicates AI generation; Suspicious/unusual objects found: Batman costume in front of city buildings, unusual fabric draping, building details

DETECTIVE ANALYSIS

What's going on here?

This image shows Batman in a highly detailed, armored suit standing against a blurred backdrop of city skyscrapers.

DEEP VERIFICATION MODELS

These independent AI models each analyze the image using different scientific methods. No single model is definitive — cross-reference all results for a complete picture.

SPAI Spectral Analysis

Score: 100% — AI-generated patterns detected
Method: Analyzes hidden frequency layers of the image (like splitting a music track into bass and treble). AI generators leave characteristic spectral signatures that differ from real camera sensors. Based on CVPR 2025 research.
Processing time: 10.1s

TruFor Splice Detection

Score: 20% — Possible splicing — some noise inconsistencies found
Method: Every camera sensor leaves a unique invisible noise fingerprint in photos. This tool (Noiseprint++, CVPR 2023) checks whether that fingerprint is consistent across the entire image. Inconsistencies suggest parts were cut from a different photo and pasted in.
Important limitation: This tool detects cut-and-paste manipulation (splicing), NOT AI generation. If an AI created or re-rendered the entire image, the noise will be uniform everywhere and this tool will show a low score — even if the content is entirely fake.
Confidence: 97% | Processing time: 9.9s
(A noise fingerprint heatmap was generated — visible in the online report. Blue areas = consistent noise, red areas = different noise pattern.)

Older AI Model Detection (RINE)

Score: 43% — Inconclusive
Method: Uses CLIP (a vision-language AI, ECCV 2024) to analyze the image at a semantic level — what objects, textures, and compositions look like internally. It checks whether these deep visual features match patterns typical of known AI generators.
Important limitation: This model was trained on older AI generators (StyleGAN, ProGAN, early Stable Diffusion, early DALL-E). It will NOT detect images from newer generators such as Gemini, FLUX, or the latest Midjourney versions.
Processing time: 2.5s

Summary of Deep Verification:

Model	Score	What it checks
SPAI (Spectral)	100%	Frequency patterns
TruFor (Splice)	20%	Noise fingerprint
RINE (Semantic)	43%	Visual features

IMAGE METADATA & EXIF INFORMATION

■ **Metadata Analysis Summary:**

- Total EXIF Tags: 0
- GPS Data: ✗ Not found

EXIF & Metadata Analysis

No EXIF Data Found
